

Task 7:

Implement various txt/csv file operations.

Date: 10-09-21

7.1

Aim:- To write a python program for creating and updating student registration details using txt file operations.

Algorithm

1. Start
2. using open() method, create and write text file "myfile.txt" with student details.
3. update the new registered student details using append operation in it.
4. Open the file in read mode and using read() method print the student details.
5. Using seek method print the Particular student record.
6. using tell method print the current position of the file.
7. Close the file
8. Stop.

Program

```
file = open("student1.txt", "w")
input1 = input("Enter column name\n")
file.write(input1)
file.write("\n")
n = int(input("Enter the no. of students"))
input1 = input
for i in range(n):
    input1 = input("Enter student details with for new")
    file.write(input1)
    file.write("\n")
file = open("student1.txt", "a")
input3 = input("Enter updated student details\n")
file.write(input3)
file = open("student1.txt", "r")
Print("Student details using Read function is:")
line = file.readline()
len = len(line)
print(len)
file.seek(len+1)
Print("Output of Readline (first student record) function is:")
Print(file.readline())
f = file.tell()
Print(f) file.close()
```

Output

Student Details using Read function is:

VTUNo	NAME	AGE
2305	RAM	20
1920	Shiva	21
2305	Arjun	19

The length of first line is:

15

Output of Readline (first student record) function is

2305 RAM 20

Find the current position of (file pointer)

(eq.

Date: 10/9/25
The counting cases:

Construct a python program whose file name "is merge.txt". To illustrate the below content inside of the file.

"python is a High level language, developed by Guido van Rossum in 1991".

Count the number of uppercase, lower case, and digits used in the text file "merge.txt".

Program to count upper case, lower case, and digits in a file (merge.txt)

step 1: create and write content to the file.

with open ("merge.txt", "w") as f:

f.write ("python is High level language, developed by Guido van Rossum in 1991")

step 2: open the file for reading.

with open ("merge.txt", "r") as f:

text = f.read()

step 3: Initialize counters

upper-count = 0

lower-count = 0

digit-count = 0

step 4: count upper case, lower case, and digits
for char in text:

if char.isupper():

upper-count += 1

elif char.islower():

lower-count += 1

elif char.isdigit():

digit-count += 1

Print ("upper case letters:", upper-count)

Print ("lower case letters:", lower-count)

Print ("digits:", digit-count)

Print (f" {upper-count}, {lower-count}, {digit-count}").

output

upper case letters: 5

lower case letters: 47

Digits: 4

5, 47, 4.

7:31

construct a python program to read the above table of students grades from a text file (grades.txt) calculate average grade for each student and print out the result as students name along their average grade using another text file (results.txt).

Program:

Program to read student's grades from a file, calculate averages, and save

results

step 1: Read input data from grades.txt

with open("grades.txt", "r") as f:

lines = f.readlines()

step 2: Extract number of students

n = int(lines[0].strip())

step 3: Extract weights

weights = lines[1].strip().split()

weights = [float(w) for w in weights]

step 4: process each student's data

students = []

for i in range(1, n+1):

parts = lines[i].strip().split()

name = parts[0]

marks = [int(m) for m in parts[1:]]

total = 0

for g in range(4):

total = total + marks[g] * weights[g]

students.append((name, round(total, 2)))

step 5: write results into results.txt

with open("results.txt", "w") as f:

for name, avg in students:

f.write(name + " → " + str(avg) + "\n")

print("Average grades have been written to results.txt")

VEL TECH	
EX NO.	
PERFORMANCE (5)	7
ANALYSIS (5)	5
VIVA VOCE (5)	5
RECORD (5)	5

Result:- The programs using txt/csv file operations are executed and verified successfully.

output

Gaurav $\rightarrow 169.0$

Abhinav $\rightarrow 138.0$

Harvard $\rightarrow 151.0$

Jai $\rightarrow 163.0$

Ravi $\rightarrow 188.0$
