

Task 2: Implement conditional, control and looping statements.

Date: 13/8/25

Aim: To implement conditional control and looping statements using Python.

Algorithm:

1. Start
2. Get the input mark from the user.
3. with the use of an if. elif. else statement, do
 - if the marks is ≥ 90 print grade "A"
 - if the marks is between 80 and 89 print grade "B"
 - if the marks is between 70 and 79 print grade "C"
 - if the marks is between 60 and 69 print grade "D"
 - if the marks is below 60 print grade "F".

Program:

Input:

score = int(input("Enter the score:"))

if score >= 90:

print("The grade is A")

elif (score <= 89 and score >= 80):

print("The grade is B")

elif (score <= 79 and score >= 70):

print("The grade is C")

elif (score <= 69 and score >= 60):

print("The grade is D")

else:

print("The grade is F")

Output:

Enter the score: 60

The grade is D.

Task 2.2

Date: 13/8/25

Aim: write a python program that uses ladderized if-elif-else statements

Algorithm:

1. Accept battery percentage from the user.
2. use ladderized if-elif-else to determine the health category.
 - if $\text{percentage} \geq 90 \rightarrow$ "Excellent battery Health"
 - if $70 \leq \text{percentage} < 90 \rightarrow$ "Good Battery Health"
 - if $40 \leq \text{percentage} < 70 \rightarrow$ "Average Battery Health"
 - If $\text{percentage} < 40 \rightarrow$ "Poor Battery Health"

Python program:

Battery Health Checker.

```
Percentage = int(input("Enter battery percentage:"))
```

```
if percentage >= 90:
```

```
    print("Excellent Battery Health")
```

```
elif percentage >= 70:
```

```
    print("Good Battery Health")
```

```
elif percentage >= 40:
```

```
    print("Average Battery Health")
```

```
else:
```

```
    print("Poor Battery Health")
```

Input:

Battery charge Percentage(Integer)

Output:

Enter battery Percentage: 85
Good Battery Health.

Date: 13/8/25

2.3 You're coding a system at an amusement park that checks the height of each visitor.

- If the height is 120 cm or more print "Allowed"
 - otherwise, print "Not allowed".
- Repeat this for 5 visitors.

Algorithm:-

1. Start the program
2. Set the total number of visitors of 5
3. Loop from visitor 1 to visitor 5
 - Accept the height of the visitor as input (in cm)
 - If height is greater than or equal to 120, print "Allowed"
 - else, print "Not allowed".
4. End the loop after 5 visitors have been checked.
5. Stop the program.

VEL TECH	
EX NO.	2
PERFORMANCE (5)	5
RESULT AND ANALYSIS (5)	5
VIVA VOCE (5)	5
RECORD (5)	
TOTAL (20)	15

Result:-

Thus, the Python program was successfully implemented using conditional statement (if-else), control flow, and looping statements.

Program:

for i in range(1,6):

height = int(input("Enter height to visitor {i} in cm:"))

if height >= 120:

Print("Allowed to ride")

else:

Print("Not allowed to ride.")

Sample Input:

Enter height of visitor 1 in cm: 130

Enter height of visitor 2 in cm: 110

Enter height of visitor 3 in cm: 150

Enter height of visitor 4 in cm: 90

Enter height of visitor 5 in cm: 125

sample outputs
